1899.

LETTER OF TRANSMITTAL.

U. S. DEPARTMENT OF AGRICULTURE,
WEATHER BUREAU,
Washington, D. C., November 11, 1899.

Hon. JAMES WILSON,
Secretary of Agriculture.

SIR: I have the honor to submit herewith the manuscript of a paper entitled, "The Climate of San Francisco, Cal.," by Alexander G. McAdie, forecast official, and George H. Willson, local forecast official, and to recommend its publication as a bulletin of the Weather Bureau.

The climatic characteristics of the Pacific coast and the peculiar local environment of San Francisco combine to make a report of this character both interesting and instructive. The authors have presented the climatological data accumulated at the San Francisco station during the last thirty years in considerable detail, yet not more so than is warranted by the lack of such information and the relative importance of San Francisco as an objective point for many of our citizens who visit the Pacific coast.

Very respectfully,

WILLIS L. MOORE,
Chief United States Weather Bureau.

Approved:

JAMES WILSON, *Secretary.*

THE CLIMATE OF SAN FRANCISCO.

The city of San Francisco is justly famed for its peculiar climate. To a large degree the topography of a section controls its climate, and it is not surprising, therefore, to find that in the vicinity of San Francisco the topography is exceedingly diversified.

From the Weather Bureau station on Mount Tamalpais—elevation of station, 2,373 feet¹—one looks down to the west on the broad expanse of the Pacific. From the open roadstead of Drakes Bay the eye passes over the Sausalito Hills to the headlands at Points Bonita and Lobos, marking the entrance to the Golden Gate. This passage plays an important rôle in connection with the winds, temperature, and fogs of the San Francisco Bay region. At mean tide the area of San Francisco Bay is about 450 square miles.

Far on the eastern horizon, especially on clear winter days, the snows of the Sierras, 155 miles distant, can be seen glistening. These mountains vary in height from 8,000 to 14,000 feet.

Extending from the slopes of the Sierras to the Coast Range is a great basin, 500 miles long and about 50 wide. The Sacramento and the San Joaquin rivers flowing through this basin unite in Suisun Bay. This great inland basin, surrounded by mountain walls, is connected with the Pacific Ocean by the Gate at San Francisco, San Francisco Bay, San Pablo Bay, Carquinez Straits, and Suisun Bay.

If a native of San Francisco were asked which was the coldest month of the year, he might be unable to answer, and if asked which was the warmest he might say November. This confusion arises from the comparatively small range of temperature. The mean annual temperature, as determined from the records of the Weather Bureau for 28 years, is 56.2°. May and November have practically the same temperature. The warmest month is September, 60.9°; the coldest January, 50.1°; the other months have mean temperatures as follows: February, 52°; March, 54°; April, 55°; May, 57°; June, 59°; August, 59°; October, 60°; November, 56°; December, 52°.

The highest temperature ever recorded in San Francisco was 100° on June 29, 1891, and the lowest 29° on January 15, 1888. Abnormally warm and cold periods last, as a rule, about three days. The mean of the three consecutive warmest days at San Francisco has never exceeded

¹ West Peak, 2,604; Middle Peak, 2,520; East Peak, 2,592; latitude, 37° 56" N.; longitude, 122° 36" W.

76.3°. A period of warm weather during the summer months is, as a rule, brought to a close about the evening of the third day with strong west winds, dense fog, and temperatures ranging from 49° to 54°. The mean of the three consecutive coldest days was 40.7°. The greatest daily range of temperature was 43° on June 29, 1891. This was the date when the temperature reached 100°. The range of temperature was from 100° to 57°. The morning was calm and very warm while at 5 p. m. the temperature was 80° and next morning 74°.

Since the establishment of the Weather Bureau on Mount Tamalpais it has been evident that the conditions at San Francisco are those of sea level, while very different and more normal conditions prevail at elevations of several thousand feet. Thus, the mean monthly temperatures of San Francisco and Mount Tamalpais show that the seasonal changes are masked at the lower station while plainly marked at the upper:

1898.

	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Mean.
Mount Tamalpais.	40.8	46.4	46.6	56.0	50.5	61.9	70.0	67.5	62.6	59.4	51.2	45.7	54.9
San Francisco.....	46.7	52.6	51.2	54.5	52.6	59.0	56.0	58.0	59.0	61.2	55.4	49.7	54.7

The difference in temperature on summer days is often very great. During the month of June, 1899, an attempt was made to use this vertical thermal gradient in practical forecasting. It would perhaps be more accurate to describe this difference as a thermal decrement, since it is largely a cooling due to the proximity of the Pacific with its 16,000,000 square miles of water, the mean temperature of the ocean water along the northern coast of California averaging 55°.

Including every day in the month of June there was found to be a mean daily difference of 11.4°, or, in other words, from the data obtained by means of this mountain station, checked by data from Point Reyes and Mount Hamilton, the temperature rose at the rate of 1° for every 203 feet of elevation. This increase held at least up to 2,380 feet.

If we consider only those days in the month (24) when there was a rise with elevation, we have for the mean daily difference in temperature between Mount Tamalpais and San Francisco 15.3°; i. e., the temperature rises 1° for every 155 feet elevation. This may be adopted as a working normal summer-day gradient.

For days when there was a decrease in temperature with elevation, 6 in all, we find a difference of 5.9°, or there was 1° fall for every 402 feet, which it may be noted is not quite as steep a gradient as values generally given in text-books—1° for every 300 feet.

We notice first that periods of rainy or cloudy and cold weather occur when the surface temperatures are higher than those of the upper level. It would seem as if at these times the different air strata from sea level to 2,500 feet had been intermingled to some degree, and

the cold layer usually existing close to the surface had been temporarily displaced.

Fogs seem to occur at times of steep inverted gradients; in other words, when the temperature of the 2,500-foot level is considerably higher than at sea level.

The summer fogs of San Francisco result from a chilling of the upper warm air, descending to the ocean surface, and particularly over the cold current close to the shore. There is a great difference of temperature between the valley and the ocean, often 50° within as many miles, and this is probably the prime factor in establishing a marked air movement, shown by the strong indraft through the Gate on summer afternoons (see charts of hourly wind velocity, 3 to 7 p. m.).

An interesting instance of the effect of fog in lowering the temperature occurred on July 25, 1899. At Mount Tamalpais at about 4 a. m. the temperature was 64°; at 5 a. m. the fog rose until it reached a height of 2,200 feet and the temperature fell to 47°. The temperature at San Francisco at the same hour was 54°.

Passing from the fogs of the summer months, the seasonal character of the rainfall demands attention. Referring to the tables and charts accompanying, it will be seen that July and August are practically without rain, while December and January together have nearly 10 inches. The annual rainfall is 23 inches.

By comparing the seasonal rainfall with the crop yield it would appear that in years when the rain falls generously in March and April the yield is largest, other things being equal. In other words, it is the time distribution of the rain, more than the intensity or total rainfall, which benefits vegetation.

The Weather Bureau (Signal Service) office was originally located in the Merchants' Exchange Building, and the first observation taken February 2, 1871. The office was moved to the Phelan Building September 4, 1890. On November 1, 1892, it was moved to its present quarters in the Mills Building.

The present elevations of instruments above the ground are, thermometers 161 feet, rain gauge 154 feet.
